

Premiere Pro Export to Media Encoder

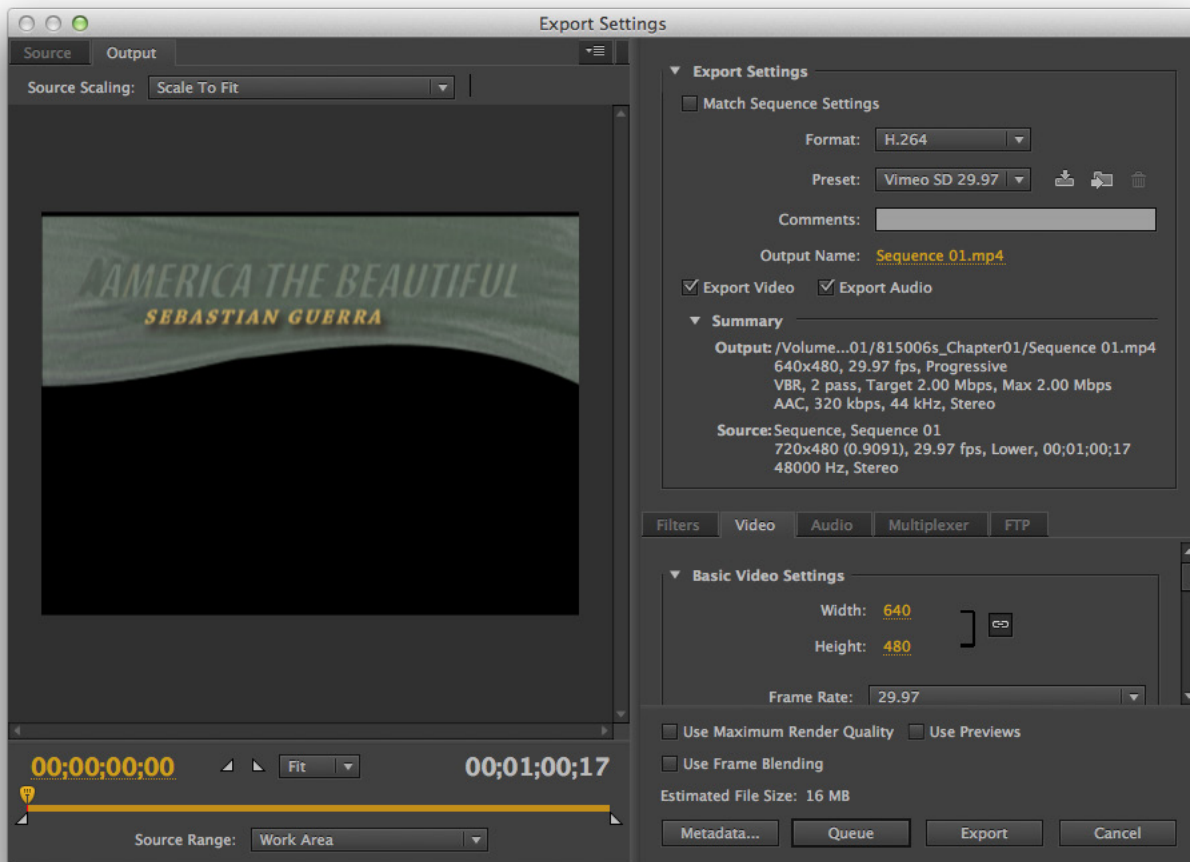

How to create a Web-Ready Video

Follow these steps to produce a web-friendly-sized (640 x 480), gradable file that can displayed/used in your businesswebsite.

In Premiere Pro

Match Export Settings shown in screen shot below.

Format: H.264
Preset: Vimeo SD 29.97
Output Name: This may (will) change depending on whichever chapter project (sequence) is to be encoded.
Export Video: Checked
Export Audio: Checked

After confirming the settings, click on Queue (this opens Media Encoder)...

Premiere Pro Export to Media Encoder

In Media Encoder

Confirm that the Preset settings H.264, Vimeo SD 29.97 are correct and visible under Sequence 01 in Queue Panel.

If not, that same Preset can be found (and applied) from the Preset Browser Panel > System Presets > Web Video section.

Target (click on) Sequence 01, click (Green Arrow) Start Queue (or Return).

This starts the video rendering/encoding process to create the web-sized file that you'll need to use in your website (for course grading).
